CONTENTS

Foreword ................................................................. xi
Preface ................................................................. xiii

NEW DIRECTIONS IN TIME SERIES ANALYSIS, PART II

Recent developments in location estimation and regression
for long-memory processes ................................. 1
Jan Beran

Phase-transition in statistical physical models with discrete
and continuous symmetries ............................... 11
P.M. Bleher and P. Major

Identification of linear systems from noisy data ................. 21
M. Deistler and W. Scherrer

Unit roots in U.S. macroeconomic time series: A survey
of classical and Bayesian perspectives .................. 43
David N. Dejong and Charles H. Whiteman

A nonparametric approach to nonlinear time series analysis:
Estimation and simulation ................................. 71
A. Ronald Gallant and George Tauchen

Asymptotics of predictive stochastic complexity ............. 93
László Gerencsér and Jorma Rissanen

Smoothness priors ............................................... 113
Will Gersch

An extension of quadrature-based methods for solving
Euler conditions ............................................... 147
Eric Ghysels and Alastair Hall

Long memory shot noises and limit theorems
with application to Burgers’ equation .................... 153
L. Giraitis, S.A. Molchanov and D. Surgailis

On approximate modeling of linear Gaussian processes ........ 177
Andrea Gombani and Claudia Polini
On the identification and prediction of nonlinear models ................. 195
   D. Guegan

Identification of stochastic time-varying parameters ..................... 211
   L. Guo, H.F. Chen and J.F. Zhang

Convergence of Åström-Wittenmark’s self-tuning regulator and related topics ........................................ 225
   Lei Guo and Han-Fu Chen

On the closure of several sets of ARMA and linear state space models with a given structure ......................... 239
   B. Hanzon

Weak convergence to self-affine processes in dynamical systems .......... 255
   Michael Lacey

Recursive estimation in ARMAX models .................................. 263
   Tze Leung Lai

On adaptive stabilization and ergodic behaviour of systems with Jump-Markov parameters via nonlinear filtering ............ 289
   Karim Nassiri-Toussi and Peter E. Caines

The convergence of output error recursions in infinite order moving average noise ........................................ 315
   Wei Ren and P.R. Kumar

Linear models with long-range dependence and with finite or infinite variance .............................................. 325
   Gennady Samorodnitsky and Murad S. Taqqu

Posterior analysis of possibly integrated time series with an application to real GNP .................................. 341
   Peter Schotman and Herman K. van Dijk

On network structure function computations ............................... 363
   Edward C. Waymire

Asymptotic properties of estimates in incorrect ARMA models for long-memory time series ............................ 375
   Yoshihiro Yajima
