Lattice polytopes and Ehrhart series

Definition

A *lattice polytope* P is the convex hull in \mathbb{R}^d of a finite set of vectors in \mathbb{Z}^d .

Definition

The *Ehrhart series* of a lattice polytope P is the generating function

$$E_P(t) := 1 + \sum_{m \in \mathbb{Z}_{\geq 1}} |mP \cap \mathbb{Z}^d| t^m$$

Theorem (E. Ehrhart (rationality), R. Stanley (non-negativity))

If P is d -dimensional, then

$$E_P(t) = \frac{\sum_{j=0}^d h_j^* t^j}{(1-t)^{d+1}} =: \frac{h_P^*(t)}{(1-t)^{d+1}},$$

where the h_j^* 's are non-negative integers.

Free sums

Free sums and type
vectors

Another approach to
proving unimodality

Let e_i denote the i -th standard basis vector in \mathbb{R}^d .

Example

Denote by Lef_d the convex hull of the vectors

$$e_1, \dots, e_d, -de_1 - \sum_{k=2}^d (d+1)e_k,$$

Then

$$h_{Lef_d}^*(t) = 1 + (d+2)t + (d+2)t^2 + \dots + (d+2)t^{d-1} + t^d$$

(reasonably straightforward computation).

Example

Denote by C_d the convex hull of the vectors

$$\begin{aligned} & -\sum_{i=1}^d e_i, \quad e_1 - \sum_{i=2}^d e_i, \\ & e_2 - \sum_{i=3}^d e_i, \\ & \vdots \\ & e_{d-1} - e_d, \\ & e_d. \end{aligned}$$

Then

$$h_{C_d}^*(t) = (1+t)^d$$

(immediate consequence of work by M. Beck, T. McAllister, and P. Jayawant on affine free sums).

Example

Denote by $LecHall_d$ the convex hull of the vectors

$$\begin{aligned} &e_d, \quad (d-1)e_{d-1} + de_d, \\ &(d-2)e_{d-2} + (d-1)e_{d-1} + de_d, \\ &\vdots \\ &2e_2 + \cdots + de_d \\ &e_1 + 2e_2 + \cdots + de_d. \end{aligned}$$

Then

$$h_{LecHall_d}^*(t) = \sum_{\pi \in \mathfrak{S}_{d-1}} t^{\text{des}(\pi)}$$

(implicit in work of S. Corteel, S. Lee, and C. Savage, not straightforward). The integer points in $LecHall_d$ are precisely the lecture hall partitions satisfying $\lambda_d - \lambda_{d-1} = 1$.

A few observations

- ▶ The polytopes C_d , Lef_d , and $LecHall_d$ are all simplices, i.e. the convex hull of $d + 1$ points in \mathbb{R}^d .

Integral closure

Definition

A lattice polytope P in \mathbb{R}^d is *integrally closed* if for every $m \in \mathbb{N}$ and every

$$z \in mP \cap \mathbb{Z}^d,$$

there exist

$$x_1, \dots, x_m \in P \cap \mathbb{Z}^d \text{ such that } x_1 + \dots + x_m = z.$$

Integral closure

Definition

A lattice polytope P in \mathbb{R}^d is *integrally closed* if for every $m \in \mathbb{N}$ and every

$$z \in mP \cap \mathbb{Z}^d,$$

there exist

$$x_1, \dots, x_m \in P \cap \mathbb{Z}^d \text{ such that } x_1 + \dots + x_m = z.$$

- ▶ There is a closely-related notion of P being *normal* — while integral closure implies normality, the converse does not always hold.
- ▶ In the literature, the distinction between these two notions is often blurred.
- ▶ Existence of a unimodular triangulation of P implies integral closure.

Definition

A lattice polytope P containing 0 in its interior is *reflexive* if any of the following (equivalent) conditions hold:

- ▶ $h_i^* = h_{d-i}^*$ for all $i = 0, \dots, d$.
- ▶ The dual of P is also a lattice polytope.
- ▶ The facets of P are each lattice distance 1 from the origin.

Equivalences due to T. Hibi.

Interesting properties of reflexives

Another approach to
proving unimodality

Theorem (W. Bruns & T. Römer)

If P is

- ▶ reflexive and
- ▶ admits a regular unimodular triangulation (hence is integrally closed),

then $h_P^*(t)$ is the h -polynomial of the boundary complex of a simplicial polytope. Thus, $h_P^*(t)$ is unimodal.

Note: This actually holds for any Gorenstein polytope P .

Reflexive simplices

It is reasonable to focus attention on unimodal h^* -vectors for reflexive simplices because:

Another approach to
proving unimodality

For any integrally closed lattice simplex $P \subseteq \mathbb{R}^n$ with vertices $\{v_0, \dots, v_n\}$, the Hilbert series of the 0-(Krull)-dimensional algebra

$$R_P := \mathbb{C}[x^a z \mid a \in P \cap \mathbb{Z}^n] / (x^{v_0} z, \dots, x^{v_n} z),$$

graded by the exponent on z , is equal to $h_P^*(t)$. Here $x^a := x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n}$.

Existence of a *weak Lefschetz element* in R_P implies unimodality of $h_P^*(t)$.

Theorem (BB & R. Davis)

For every $d \geq 3$, R_{Lef_d} does not admit a weak Lefschetz element.

It is possible that quotienting the semigroup algebra generated by Lef_d by a different system of parameters would admit a weak Lefschetz element.
